AVERAGE:											-0.07									
Estimated upward flow through the confining unit in the southern area, which has a upward gradient.																				
AREA (acres)											55091									
FLOW (ft ³ /d)											-119551									
FLOW (acre-ft/yr)											-1002									

Head difference is the difference between the shallow aquifer water-level altitude and the deep aquifer water-level altitude at these well locations.

It is based on the potentiometric map of the deep aquifer and the water levels in these shallow aquifer wells.

Water-level data for shallow aquifers is limited within the study area. Older data were used to help delineate areas of upward and downward gradient.
